

Development Summary

1. Sign-Up Flows

There will be four primary sign-up/registration flows:

1. Standard User Sign-Up

- Users should be able to register through the standard sign-up flow.
- The flow should capture the required user and organization details based on the user type:
 - Employer
 - College
 - Student/Candidate

2. Sign-Up with Discount Code

- A discount/promo code can be applied during the sign-up/payment flow.
- Discount codes will be generated from the **Admin Panel**.
- The applicable user/entity types for a discount code should be configurable:
 - Employer
 - College
 - Student/Candidate
- The discount should be applied to the applicable payment during registration.

3. Admin-Driven Registration

The Admin should be able to register users directly from the Admin Portal.

Admin should be able to create/register:

- Employer
- College
- Student/Candidate

The registration should create the required account/profile and maintain the appropriate role and organization association.

4. Organization Email Invitation

- Admin should be able to send an invitation to the user's organizational/institutional email.
 - Invitations can be sent to:
 - Employers
 - Colleges
 - Students/Candidates
 - The recipient should be able to use the invitation to complete their registration/onboarding.
 - The invitation should be associated with the relevant organization and user type.
-

2. Discount/Promo Code Management

A complete discount-code management mechanism needs to be implemented in the backend and exposed through the Admin Portal.

Backend Requirements

The backend should support:

- Discount code generation
- Unique discount code creation
- Discount percentage/fixed-value configuration, as applicable
- User/entity-type association:
 - Employer
 - College
 - Candidate
- Code validity/expiry
- Usage limits, if required
- Tracking whether the code has been used
- Tracking which user/organization used the code
- Tracking the date/time of usage

Discount Code Logs

A complete audit/usage log should be maintained.

Example information:

Field	Description
Discount Code	Generated promo code
Generated For	Employer / College / Candidate
Discount Value	Percentage or fixed amount
Generated By	Admin who created the code
Created At	Code creation timestamp
Expiry	Code expiration date
Usage Limit	Maximum permitted usage
Usage Count	Number of times used
Used By	User/organization that used it
Used At	Timestamp of usage
Status	Active / Expired / Exhausted

The relevant information should be available through the **Admin Frontend**, while the backend should maintain the source-of-truth records and audit logs.

3. Profile Scoring Mechanism

The profile scoring mechanism will be changed.

- The existing profile-scoring logic will be updated.
 - The final scoring mechanism/criteria will be provided separately after the relevant profile/onboarding requirements are completed.
 - The backend should therefore keep the scoring logic modular so that the new scoring rules can be integrated without major changes to the existing profile architecture.
-

4. Phone OTP

Current Scope

Phone OTP registration is not required at this stage.

Reason:

- The organization/required registration setup is not currently in place.
- Once the organization is officially registered and the required setup is available, phone OTP registration can be implemented.

Current Implementation

For now:

- Do not implement phone-number OTP verification.
 - Keep the authentication architecture flexible enough to add phone OTP later.
 - Email-based registration/invitation flows should continue as the current mechanism.
-

5. Overall Development Scope

Immediate Development

1. Standard sign-up flow
2. Sign-up with discount/promo code
3. Admin-driven registration
4. Organization email invitation flow
5. Discount code generation in backend
6. Discount code management in Admin Portal
7. Discount-code usage/audit logs
8. Backend support for discount-code validation and usage tracking
9. Updated profile-scoring architecture
10. Keep phone OTP deferred

Deferred

- Phone OTP registration/verification — to be implemented once the required organization registration/setup is completed.
- Final profile scoring rules — to be incorporated once the scoring mechanism is provided.
